

DELIVERY NOTE FEATURE

Executive Summary — Feature Vision

Product: Repzo Author: Mohammad Hatahet Date: March 2026

OVERVIEW

The Delivery Note (DN) introduces a formal delivery lifecycle into Repzo. It separates the physical delivery of goods from the financial transaction, enabling custody tracking, reservation management, and delivery confirmation through a rep-driven approval cycle.

There are two entry points for delivery. An Invoice-based flow where the DN is created from an existing Invoice, and a Sales Order-based flow where the DN is created directly from an SO before invoicing.

FLOW A: INVOICE-BASED DELIVERY

When an Invoice is created, it triggers a financial transaction and an optional inventory transaction controlled by a checkbox at Invoice creation:

Path 1 — Inventory transaction enabled: The inventory transaction is created at Invoice creation. Items are immediately marked as delivered. No DN is needed. This is the fast path for direct delivery.

Path 2 — No inventory transaction: A reservation record is created and Invoice items are labeled as reserved. Delivery must go through the DN transfer cycle. A DN is created from the Invoice (fully or partially) with an assigned rep. Once the DN is approved by the rep, the Invoice is marked as delivered.

Flow A: Invoice-Based Delivery

Flow A: Invoice-Based Delivery

FLOW B: SALES ORDER-BASED DELIVERY

A Sales Order is created with an optional reservation. A DN is created from the SO (fully or partially) with an assigned rep. Items are labeled as noted for delivery. Once the DN is approved by the rep, the SO is marked as delivered.

DN STATUS CYCLE

DN Status Cycle

Status	Trigger	Effect	Reservation Impact
Pending	DN created	Items labeled as noted for delivery	Reservation active (items locked)
Processing	First transfer created from DN	Transfer initiated, goods in transit	Reservation revoked
Approved	Rep confirms delivery	Goods txn: rep → client. Invoice/SO items marked as delivered.	N/A (already revoked)
Canceled	Client rejects / DN canceled	Delivery aborted. No goods transaction.	Revoked if canceling from Pending. Already revoked if from Processing.

RESERVATION LOGIC

A reservation record is the system’s mechanism for locking inventory against a specific delivery intent. It is created when an Invoice (without inventory transaction) or a Sales Order is created, and revoked when the DN transitions to Processing or is canceled from Pending.

Reservation record contains: variant, qty, measure unit, base-unit-qty, client, sales order, DN, transfer, invoice, warehouse.

Created When	Revoked When	Open Question
Invoice created without inventory txn, or SO created with reservation enabled	DN moves to Processing (transfer created), or DN canceled from Pending	TTL (time-to-live) for reservation records — should stale reservations auto-expire?

SALES ORDER CONSTRAINTS

Constraint	Detail
SO item qty edit floor	Item quantity cannot be reduced below (noted for delivery + delivered). Prevents breaking existing DNs.
SO edit → reservation update	Any SO edit must propagate to the linked reservation record to keep reserved quantities in sync.

Invoice from partial SO

When invoicing a partially-delivered SO, the goods transaction must account for items already delivered via DN.

No partial SO invoicing

A Sales Order is invoiced fully. There is no partial invoicing of a Sales Order.

SCOPE: UI & REPORTING ENHANCEMENTS

Enhancement	Description
Transfer → DN linkage	Transfers display linked Delivery Notes. Support bulk transfer creation from multiple DNs.
Invoice & SO item filters	Invoice and SO summary/item views support filtering by delivery status: delivered vs. noted for delivery.
Reservation management screens	New screens reflecting reservation records and their relationships to SO, Invoice, DN, Transfer, and Warehouse.
Reservation impact on existing screens	Reservation data affects load, unload, invoice creation, and all stock display/comparison screens. Full impact analysis required.
